

THORPE knows these units; their operation, the lining demands and installation requirements.

Call us to help maximize the refractory performance in your Sulfur Recovery Unit.

Thorpe has been a recognized leader in Sulfur Recovery Unit refractory linings for over 50 years.

HISTORY & EXPERIENCE

Thorpe has been involved in SRUs since our incorporation in Texas in 1954. For 30 years, through the mid 1980's, Thorpe supplied the refractory-lined equipment for SRUs on a turnkey design/supply/erect basis. While technology changes in the mid 1980's resulted in Thorpe electing to end our process involvement, we gained significant insight into the operations of these units and the demands on these lining systems. Since that time Thorpe's emphasis has remained on our core business: the design/supply/installation of the refractory systems.

EXPERTISE

Thorpe possesses a unique combination of skills and experience relating to SRUs due to our past involvement in the process side of these units, our overall refractory engineering capabilities relating to complicated brick construction, and our familiarity with almost all OEM's equipment and lining specifications. From the maintenance side, we see what works and what does not work in various manufacturer's units under different operating conditions. Our refractory technical knowledge then allows us to incorporate these "lessons learned" into our engineered solutions and recommendations for specific customer applications.

PROJECT OVERVIEW

Engineering and detailed construction drawings are centrally coordinated in our Houston, Texas office. Experienced project management, supervision and field crews are maintained at each of our construction office locations. Each office is knowledgeable in SRU refractory lining requirements. Priority is given to safety, project schedule and quality of the work performed. Thorpe's primary goal for the job is customer satisfaction, meeting all of your needs and expectations.

COORDINATED REFRACTORY APPROACH

Our objective is to be known as your SRU refractory knowledge source. Our goal is to help your engineering, inspection and maintenance departments by assisting in your SRU refractory inspections, recommending repairs and technical improvements and performing your SRU refractory work. We understand SRUs have the most severe operating environments in a refinery capable of melting the best refractories available today. The high temperatures now experienced in O₂ enriched service can result in continuous operation at the edge of refractory capabilities. Emission penalties now demand reliability from these linings as an unexpected SRU outage can negatively impact the entire refinery.

THORPE

3 KEYS TO RELIABILITY

1. Proper Material Selection
2. Engineered Lining Design
3. Experienced Installation Crews

CALL US TO LEARN MORE ABOUT THE THREE KEYS TO RELIABILITY FOR SRU REFRACTORY LININGS AND TO GET A REVIEW OF YOUR REACTION FURNACE LINING SYSTEM.
